ELAN1 GOVERN · FRONT END · CLOSING REPORT

The 17 changes — done and verified

28 October 2026. This report covers every change in `16-remaining-changes`, which includes the 5 partly fixed items from `15-fix-verification`. It covers L1, L2, L3 and Sovereign. No public-site pages were touched, and pricing was not changed.

Answer: all 17 changes are made, and an independent check confirmed each one in the code. The 5 partly fixed items are now fully fixed.

- Two changes (7 and 16) were incomplete after the first pass. The check caught them and a second pass finished them.
- Two small side effects the check found were fixed too.
- One more empty refusal class of the same kind ("Counterparty not verified") was removed.

The type-check, build, Seal v6 test vectors, bundle checks and link crawl all pass. **All 87 items listed in reports 11 and 13 are now fixed.**

How it was done.

- Four fixers worked in parallel, each on its own files.
- For each area, a separate read-only checker traced every change through the code, from screen to API to mock, and graded it Fixed, Partly fixed or Not fixed. Where it found a gap or a side effect, a third agent finished the work.
- An integrator then ran the type-check, the build and the verifier check scripts.
- I fixed the leftovers myself, corrected the README, checked the main fixes in the browser and crawled all four levels.

1. Summary

17 / 17	87 / 87	0	64 / 64	0
CHANGES VERIFIED FIXED	ITEMS FROM REPORTS 11 AND 13 NOW FIXED	TYPE OR BUILD ERRORS	SEAL V6 VECTORS	CRAWL PROBLEMS

2. Each change, and how it was verified

#	CHANGE	STATUS	WHAT WAS DONE AND HOW IT WAS VERIFIED
1	"Erased data" class on Not done (items 11 #16, 13 #17)	Fixed	Removed from Not done, Activity and the type. Searching the code finds no "Erased data" text, and in the browser neither Not done nor Refusals shows it.
2	"Signed" in L1 developer copy (13 #3)	Fixed	Every rulebook mention in the developer portal now says it is published, and that from L2 each version is also signed. The checker searched every remaining "signed" in the portal; all are explicitly L2+ or L3.

3	Receipt page and Refusals misread guard refusals (13 #36)	**Fixed**	The guard-rule list now has `tool-disabled`, the four consent ids, `RECEIPT_WRITE_FAILED` and `POLICY.TENANT_STOPPED`; `counterparty-unverified` is removed. The receipt page and Refusals use the same list. In the browser, a real consent refusal (Kaveri #1416) shows the consent explanation, not the wrong "not held" banner. A side effect in the decision trace, found by the check, was fixed.
4	Bundle file names (11 #31)	**Fixed**	Option (a): the names are kept. The developer-docs table now maps all 9 members to the specification's names, including the optional `lexicon.json`. Bundles already exported stay valid.
5	Onboarding locked keys for 30 days (L3, Sovereign)	**Fixed**	Onboarding now runs a first-key ceremony: the organisation's first customer-held key signs at once and no successor is left waiting, so key and level changes are not blocked. A guard allows this only for the first ceremony at L3 or Sovereign. Later rotations keep the 30-day overlap.
6	Agents › Keys offered a refused rotation (L2)	**Fixed**	It uses the same pending and successor checks as Proof › Keys, and Withdraw goes through the checked path.
7	Withdrawing someone else's token request	**Fixed**	Only the requester can withdraw, and only while the request is waiting. The store and the screen both enforce this. The first pass was partial; the check caught it and the token docs were corrected to match.
8	"Clauses" in the developer docs	**Fixed**	The docs say "Clause results", and Scope lists write types in the verifier's order. Searching the code finds no "Clauses" left.
9	First close-out bundle not tied to its export (L2)	**Fixed**	The file's digest must equal the recorded export's digest, or it is refused, the same as evidence requests.
10	Billing-desk credit trusted the screen	**Fixed**	The credit is read from the invoice line and capped at that amount, less any earlier credits. The seeded settlement still works.
11	Autonomy could release a pack's named-person hold (latent)	**Fixed**	Such holds are marked `pack_hold_required`, and autonomy at any level can't turn them into an allow. Confirmed with a scripted check.
12	Wrong control number on People	**Fixed**	It now says EG-20, confirmed in the browser.
13	Cookie table missing a key	**Fixed**	`eg:evidence:sent:…` is listed. The checker confirmed every storage key and cookie the code writes is now in the table.
14	Privacy notice: WhatsApp number	**Fixed**	It now says the number can also be used to approve or reject with chat buttons, and is recorded with that decision.
15	L3 receipt-code pages contradicted themselves	**Fixed**	Both now say a received receipt that fails is not added to your chain, and that the check is recorded. The API description for the same endpoint was aligned too, a side effect found by the check.
16	Out-of-date WhatsApp line	**Fixed**	The YAML reference is fixed. The check then found the same wrong line in four more console screens: the rule dialog, Notifications, You, and Channels (with onboarding). All of them were fixed in the second pass.
17	README overstated the fixes	**Fixed**	The README now describes the history accurately (11, 13, 15, 16 and this report) and lists what the 17 changes did.

Also removed: the "Counterparty not verified" refusal class in Activity, Not done and Refusals. Like "Erased data", nothing produces it, so it was always empty. A received receipt that fails its checks is simply not accepted; no agent call is refused.

3. Checks after the changes

CHECK	RESULT
Type-check and production build	Both pass, after every pass and after my last edits.
Verifier and bundles (scripted)	• **Seal v6 vectors:** 64 of 64 pass, and both implementations agree. • **Bundles:** they verify for Northbank (PASS), Kaveri (PASS_PAYLOAD_UNBOUND) and Deccan (PASS). • **Report:** it shows "Clause results" with write types. • **L1 pack:** a new pack passes, and an edited one fails. • **Exports:** the pinned range stays covered by the integrity check. • **Evidence requests:** swapped parts are refused. • **Seats:** past months are unchanged. • **Auditors:** their writes are refused. • **Keys:** the L2 two-person confirm works.
In the browser (L3)	• Not done and Refusals show neither empty class. • A consent refusal's receipt page explains the consent check. • People cites EG-20.
Live crawl	**0 problems** (broken links, error pages, script errors), signed in as an admin at each level: L1 320 pages, 34,258 links; L2 146 pages, 14,646 links; L3 320 pages, 29,773 links; Sovereign 320 pages, 27,595 links. L2 was smaller this run because some tables load after the crawl's short wait, so it found fewer links to follow; the pages themselves are fine (Northbank Records was checked by hand and its rows link correctly).

4. Known and outside these 17

- **Right after a key switch — now fixed (added after this report was first issued).** An exported bundle used to fail its key check until the new key had signed a record, because the switch receipt is signed by the outgoing key.
  - **The change.** Every ordinary rotation (L1, L2 KMS, L3 and Sovereign ceremonies, the first key at onboarding) now has the new key sign a `key.signing_started` record straight after the switch. The outgoing key still attests the handover, and the newest record is always signed by the organisation's current key.
  - **Not affected.** The verifier was not loosened. The L1 → L2 upgrade is unchanged, because its signing-on record already comes first from the new key, at the sequence named before the switch.
  - **Verified.**
    - The Northbank bundle straight after the rotations now passes with the new fingerprint pinned; it used to fail.
    - An L1 rotation's pack passes with the new fingerprint (PASS_L1_INTERNAL).
    - The L1 → L2 close-out still starts signing at the named sequence, and the first ten records all verify.
    - The onboarding first-key checks all pass.
    - The 64 Seal v6 vectors pass, and the type-check and build pass.
- **The pilot in the four demo organisations** and the time stamps on seeded events are as before.
