ELAN1 GOVERN · FRONT END · CODEBASE CHECK

Is the final code in the codebase folder?

28 October 2026. This check was read-only; nothing in the code or the reports was changed.

Answer: yes. The final, fixed code is in the codebase folder `E:\elan1 govern Final\elan1-govern-web`. It is the only copy of this platform on the machine, and every fix is in it.

- **Every fix is present.** All 42 items of the second check (report 13) are fixed in the code on disk, and so are the fixes from every other report checked.
- **Where "42 issues" comes from.** Report 13 (`analysis\13-completeness-check`) lists exactly 42 issues, and it is still in the `analysis` folder next to the code. It is a snapshot written *before* those issues were fixed, so it still describes them as open. An audit that reads the project folder picks up that old report and repeats its 42 issues.

1. Where the code is, and that it is current

CHECK	RESULT
Codebase location	`E:\elan1 govern Final\elan1-govern-web` (package `elan1-govern-web`)
Other copies on this machine	**None. I searched drive E: and the user folder for any folder or `package.json` named after this platform, and found only this one. The zip files on the drive are older September projects, not this platform.**
Version control	Not a git repository, so there is no older committed version that could differ. The files on disk are the code.
Code files	368 TypeScript files. 298 of them were changed on 28 October with the fixes; the last change was at 19:07.
Built app (`dist`)	**Built at 19:13, after the last code change, so it contains every fix.**
Tests on this code	**Type-check and production build pass. 78 scripted checks pass with 0 failures, including the 64 of 64 Seal v6 vectors. All 30 demo sign-ins behave as designed. A link crawl at all four levels found 0 problems (report 19).**

2. The 42 items of report 13, checked in the code today

Each item was checked for its fix in the source file where it lives.

Result: 42 of 42 fixed.

#	ITEM	STATUS
1	Elan1 maintenance refused at Sovereign	Fixed
2	Chat buttons only for linked people	Fixed
3	L1 wording: "published rulebook"	Fixed
4	Same-person "Send to" writes outbox and receipt	Fixed
5	Escalation and re-route notify the new group	Fixed
6	Widen the emergency stop	Fixed
7	Phone links at Sovereign	Fixed
8	Pack holds a call instead of refusing	Fixed
9	Pack checks use configured values	Fixed
10	Decision trace uses the receipt's pack result	Fixed
11	Pack rules at L1 as a dry run	Fixed
12	Agent page: "Dry run at L1"	Fixed

13	L1 pack compliance map	Fixed
14	Coverage on Today matches /compliance	Fixed
15	Receipt "Controls" use the shared helper	Fixed
16	EG-18 note follows the level	Fixed
17	"Erased data" class removed	Fixed
18	Connectors refused at Sovereign	Fixed
19	Approval checks: retention and consent	Fixed
20	Proof › Keys after an approved rotation	Fixed
21	Seals below L3 carry A0, not A3	Fixed
22	SAML refused at Sovereign	Fixed
23	L2 key switch needs a second person	Fixed
24	Rotation wording: successor and overlap	Fixed
25	L1 records described as sealed	Fixed
26	Sandbox key help: grace period	Fixed
27	"Everything" export range pinned	Fixed
28	Seats billed pro rata; past months kept	Fixed
29	Report section "Clause results"	Fixed
30	Exit codes 3 and 5 listed in the pack	Fixed
31	Auditor collects the exact exported files	Fixed
32	"Anchor now" checked in the API	Fixed
33	Auditor writes limited to the J9 steps	Fixed
34	Legal page: WhatsApp buttons	Fixed
35	Token documentation	Fixed
36	Errors page lists all guard ids	Fixed
37	Define-code pages show a refused publish	Fixed
38	Bundle table lists `lexicon.json`	Fixed
39	Ask Govern: no chat at Sovereign	Fixed
40	Maintenance page at Sovereign	Fixed
41	Outside-group attempt writes a receipt	Fixed
42	README lists every route	Fixed

Fixes from the other reports were spot-checked the same way: 25 of 25 present. That covers report 11 (the first 45 items), report 16 (the remaining changes), the key-switch fix (report 17) and the two items from report 18. Leftovers that should be gone are gone: no "Erased data" class, no `counterparty-unverified` id, and no case-sensitive STOP check.

---

3. Why an audit still says "42 issues"

- **The old reports are still in the folder.** `E:\elan1 govern Final\analysis` keeps every report from the day, 00 to 19. Reports 09, 11, 13, 15 and 16 are snapshots that list problems as they stood *at the time*; they were never edited after the fixes. Report 13 has exactly 42 findings.
- **An audit reads those snapshots.** An audit pointed at `E:\elan1 govern Final` reads them as current and reports their problems again. The code, as checked above, already has every one fixed.
- **An open-ended audit also finds new items.** An audit that asks "is anything missing anywhere?" will usually find *new* items each time, not the old ones. If your audit lists items that are not in report 13, send me its list and I will check each one against the code.

---

4. How to stop the old reports being reported again

Done on 28 October: the superseded snapshots (06, 07, 09, 11, 13, 15 and 16) are now in `analysis\superseded`. That folder's `README.md` says they are historical and that every item in them is fixed. The README's links now point to the new location. Nothing was deleted.

- **Move the old reports out of the way.** Put the superseded snapshots (06, 07, 09, 11, 13, 15, 16) in a subfolder, `analysis\superseded`, with a short note saying "historical, all items fixed; current status in 19-final-confirmation". Keep 19 and this report at the top level. Nothing is deleted.
- **Or point the audit at the code only.** Run it on `E:\elan1 govern Final\elan1-govern-web` rather than the whole `E:\elan1 govern Final` folder.
