ELAN1 GOVERN · FRONT END · INDEPENDENT VERIFICATION

Are all the reported items really fixed?

28 October 2026, late night. This check was read-only; nothing was built or changed. It covers every Broken, Missing and Partial item listed in `11-completeness-check` (45 items) and `13-completeness-check` (42 items), at L1, L2, L3 and Sovereign. The public site is not included.

Short answer: not completely.

- **82 of the 87 items are fully fixed** in the code as it stands now.
- **5 are only partly fixed**: their main problem is gone, but a piece remains (§3).
- **None is still unfixed.**
- **The fixes caused 13 smaller side effects** (§4). Most are wording and documentation; one (onboarding at L3 and Sovereign) affects a real flow.
- `14-fix-report` **overstated one fix.** It said the empty "Erased data" class was removed "including from Not done". It was not removed from Not done. That was my error.

How this was checked.

- **Independent checkers.** Five checkers each took one area and examined every listed item in the current code. They did not rely on the fix reports. For each item they read the original finding and traced the actual code path, from screen to API to mock, not just the wording. Each item got a verdict of Fixed, Partly fixed or Not fixed, with the file and line as evidence.
- **My own re-checks.** I re-checked every Partly verdict and the main side effects myself.
- **Earlier evidence.** These results build on the tests already run tonight: the type-check and build pass, the 64 Seal v6 test vectors pass, bundles verify at three levels, and the live crawl of all four levels found 0 problems.

1. Summary

87	82	5	0	13
ITEMS CHECKED	FULLY FIXED	PARTLY FIXED	NOT FIXED	SIDE EFFECTS OF THE FIXES

AREA	ITEMS	FULLY FIXED	PARTLY FIXED
Work door and access	19	18	1 (13 #3)
Records door and packs	23	21	2 (11 #16, 13 #17)
Agents, keys and seals	12	12	0
Assurance and billing	18	17	1 (11 #31)
Developer portal, legal, README	15	14	1 (13 #36)
Total	**87**	**82**	**5**

2. Why each new check found more items

Each check was asked an open question: is anything missing or partial anywhere? It was not asked whether last time's items were fixed. That is why every round produced a new list, even though most earlier items were in fact fixed.

ROUND	WHAT IT FOUND	HOW MANY EARLIER ITEMS WERE REALLY STILL OPEN

First check (report 11)	45 items	—
Second check (report 13)	42 items	**34 of the 45 were confirmed fully fixed.** 11 had a remaining piece. The other 31 items were new.
This verification (report 15)	Only the 87 listed items, plus side effects seen while checking	**82 of 87 are fully fixed**; 5 have a remaining piece.

The new items came from three sources:

- **Deeper reading.** Each round's reviewers start fresh and read further into areas the last round only skimmed: the developer docs, cookie and legal text, billing edge cases.
- **Side effects of large fixes.** Each fix round changed about 100 files. A change in one place can leave a neighbouring screen out of step. For example, the key-rotation fix left Proof › Keys showing an approved rotation as still waiting.
- **A long tail.** The platform is checked against several hundred pages of documents across four levels, so an open-ended hunt keeps finding something.

The severity has fallen sharply:

- **The first round** found things like a broken emergency-stop confirmation and packs that could not be installed.
- **This round's** remaining items are mostly wording, documentation and edge cases.

The way to reach "done" is a closed list: fix the items below, then verify only those, as this report does, rather than running another open-ended hunt.

---

3. The 5 items that are only partly fixed

ITEM	LEVEL	WHAT IS FIXED	WHAT REMAINS
11 #16 and 13 #17 — the "Erased data" refusal class	L1 / All	Erasure counts in Coverage from L1, and DPDP s.8(7) and s.12 are mapped. The class is gone from Activity.	The Not done page still lists "Erased data" as a class "starting at L2". It is always empty, because nothing produces it. `14-fix-report` wrongly said it was removed there. work/notDone.ts:45; work/NotDonePage.tsx:142–145
13 #3 — "signed" in L1 copy	L1	The places the report named (the Reviews erasure message, onboarding, sign-up, sign-in, the maintenance page, the developer intro) now depend on the level.	Other developer-portal copy still says the rulebook is "signed with your organisation's key" at every level: the quickstart note, the Rulebook YAML page heading and text, and the glossary. developers/sections/Start.tsx:91; developers/sections/Rules.tsx:5,47,109,115; mock/devpathData.ts:290
13 #36 — system refusal ids	All	The Errors page lists all 17 ids the guard writes, and the consent codes are from L1 in the register.	The receipt page's table of guard rules has no entry for `tool-disabled`, the four `G1_*` consent ids, `RECEIPT_WRITE_FAILED` or `POLICY.TENANT_STOPPED`. It still lists `counterparty-unverified`, which nothing writes. So a consent or disabled-tool refusal shows a wrong "rulebook version not held" banner, and Refusals doesn't mark it as refused by the guard itself. activity/shared.tsx:134–151; activity/ReceiptPage.tsx:707; assurancedoor/RefusalsPage.tsx:76–84

11 #31 — bundle member names	L2+	`lexicon.json` is now a signed member and the verifier checks it.	Member file names still differ from the specification (`receipts.jsonl` rather than `chain.json`, and so on). They are only mapped in a developer-docs table. This was deliberate, because renaming would break bundles already exported, but it was never put to you for a ruling. mock/platform.ts:979–986; lib/verify6.ts:57,65; developers/sections/Evidence.tsx:192

11 #16 and 13 #17 have the same root cause, so §3 has four rows for five items.

---

4. Side effects the fixes introduced

These are not among the 87 items. Checkers saw them while verifying and confirmed them in the code; I re-checked those marked ✓.

#	LEVEL	SIDE EFFECT	EFFECT
S1 ✓	L3, Sov	**Onboarding a new L3 or Sovereign organisation** runs the key ceremony, which now binds a successor key that switches only after the 30-day overlap. While it is bound, further key changes and level changes are refused (and recorded), unless someone turns signing on early. onboarding/complete.ts:104; api/index.ts:686; mock/platform.ts:768; mock/keys.ts:353	Medium
S2 ✓	L2	Agents › Keys still offers "Request a KMS rotation" while a successor is bound; pressing it records a refusal. Proof › Keys correctly hides the button. agentsdoor/KeysPage.tsx:168	Low
S3	All	Withdrawing a token request doesn't check that you made the request. Withdraw is shown on approved rows to any owner or admin. keys/tokenStore.ts:170–181; keys/PlatformTokens.tsx:80	Low
S4 ✓	All	The developer docs still use the old section name "Clauses" in the changelog and the sample output, and their Scope line has no write types. developers/sections/More.tsx:183; Platform.tsx:114,122	Low
S5	L2	The first close-out bundle's recorded verification isn't tied to the exported file's digest, unlike evidence requests. mock/upgrade.ts:638–642	Low
S6	All	The demo billing desk's credit amount comes from the screen, not from the invoice line. mock/billing.ts:291,351	Low (demo only)
S7	L3	When a rulebook hold meets a pack's "named person" rule, a future A4 or A5 grant could let the call run without a person. This can't happen today, because A4 and A5 are not available. mock/packChecks.ts:162–165; mock/db.ts:1061	Latent
S8 ✓	All	The People page says member changes are "control EG-11" (the AI inventory control). It should say EG-20. settings/sections/Members.tsx:193	Low
S9	L2+	The cookie table doesn't list `eg:evidence:sent:…`, the browser storage that now holds the files of a fulfilled evidence request. mock/keys.ts:903; legal/LegalPage.tsx	Low
S10	L1–L3	The privacy notice still gives the WhatsApp number's only purpose as sending links. It doesn't mention deciding with chat buttons. legal/LegalPage.tsx:82	Low

S11	All	On the 5 L3 receipt-code pages, the facts table says "a refusal receipt on the chain", but the text says the receipt is not bound into the chain. mock/devpathData.ts:156; developers/sections/Register.tsx:152	Low
S12 ✓	All	The Rulebook YAML reference says WhatsApp "always sends a signed link to the decision page". WhatsApp now also carries Approve and Reject buttons. developers/sections/Rules.tsx:72	Low
S13	All	The README says every finding in reports 11 and 13 is fixed. Given §3, that is not accurate. README.md:72,90	Low

Also noted, but not counted as faults:

- An "Everything" export's manifest now says its scope is a range, because the range is pinned at the head. That is accurate, but it is a change.
- A held-by-stop approval could write a notice receipt naming 0 people. Whether that can happen is unproven.
- Right after a key switch, an exported bundle fails its key check until the new key signs a record. This predates tonight's fixes.

---

5. Every item, with its verdict

#	REPORT 11 ITEM	VERDICT
1	STOP / RESUME confirmation	Fixed
2	Sovereign approval links	Fixed
3	Approvers resolve alerts	Fixed
4	Approvers draft assessments	Fixed
5	Approver notified	Fixed
6	Approve in chat	Fixed
7	Incident report PDF	Fixed
8	Stop banner, selected agents	Fixed
9	Approval queue filters	Fixed
10	Regulator runs a profile	Fixed
11	Install pack from Coverage at L1	Fixed
12	Admit an agent at L1	Fixed
13	"Packs start at L2" wording	Fixed
14	Pack checks on live calls	Fixed
15	Read-only counterparty register	Fixed
16	Erasure in coverage at L1	Partly
17	"Signed" in L1 erasure copy	Fixed
18	Control set	Fixed
19	Next review	Fixed
20	Replay store off	Fixed
21	Autonomy page below L3	Fixed
22	Control and operations tokens	Fixed
23	Rotating a production key	Fixed
24	Rotation overlap	Fixed
25	Sovereign OIDC sign-on	Fixed
26	Who revokes a graduation	Fixed
27	Agent keys help text	Fixed
28	Two invoice builders	Fixed
29	Exports that skipped checks	Fixed
30	Integrity run before export	Fixed
31	Bundle lexicon and member names	Partly
32	Nine-section report	Fixed
33	Auditor writes (profiles)	Fixed
34	Requests to Elan1	Fixed
35	Dispute role	Fixed
36	Enforcement per write type	Fixed
37	Retention of at least 8 years	Fixed
38	Exit-code tables on Proof	Fixed
39	Ask Govern: assessment, incident	Fixed
40	Ask Govern: rule	Fixed
41	System refusal ids in docs	Fixed
42	L1 pack members in docs	Fixed
43	Refusal register	Fixed
44	Cookie table	Fixed
45	Public 404	Fixed

#	REPORT 13 ITEM	VERDICT
1	Elan1 maintenance at Sovereign	Fixed
2	Chat buttons for unlinked people	Fixed
3	"Signed" in L1 copy	Partly
4	Same-person "Send to"	Fixed
5	Escalation and re-route notices	Fixed
6	Widen the stop	Fixed
7	Phone links at Sovereign	Fixed
8	Pack checks on held calls	Fixed
9	Pack configuration	Fixed
10	Decision trace pack step	Fixed
11	Pack rules at L1	Fixed
12	Agent page "Starts at L2"	Fixed
13	L1 pack compliance map	Fixed
14	Coverage on Today and AI systems	Fixed
15	Receipt "Controls"	Fixed
16	EG-18 note	Fixed
17	"Erased data" class	Partly
18	Connectors at Sovereign	Fixed
19	Approval-screen checks	Fixed
20	Proof › Keys after approval	Fixed
21	L2 records sealed with A3	Fixed
22	SAML and onboarding at Sovereign	Fixed
23	One-person KMS rotation	Fixed
24	Rotation copy	Fixed
25	"L1: signed and chained"	Fixed
26	Sandbox key help	Fixed
27	Integrity check on "Everything"	Fixed
28	Counterparty seat line	Fixed
29	Nine-section naming (console)	Fixed
30	Exit codes outside Proof	Fixed
31	What the auditor collects	Fixed
32	Anchor now	Fixed
33	Other auditor writes	Fixed
34	Legal: WhatsApp sub-processor	Fixed
35	Token documentation	Fixed
36	System refusal ids (Errors, receipt page)	Partly
37	Define and L3 code pages	Fixed
38	Bundle table and changelog	Fixed
39	Ask Govern rule at Sovereign	Fixed
40	Maintenance page at Sovereign	Fixed
41	Outside-group attempt receipt	Fixed
42	README routes	Fixed

---

6. What it would take to close this out

- **The 5 partly fixed items and the 13 side effects** are all small and local, except S1, which is about onboarding. Together they are a closed list of 17 changes (two of the partly fixed items share a cause); one agent working through the list is enough.
- **11 #31 needs your ruling.** Keep today's member file names with the documented mapping, or rename them to the specification's names. Renaming means bundles exported before the change no longer match.
- **After those fixes, verify only that closed list**, as this report does. Another open-ended "check everything" will always find something new in a platform of this size.

---

7. Limits of this check

- **Code, not clicks.** This round traced code; it didn't click through the app. The live crawl and the scripted checks run earlier tonight cover rendering, links, the verifier and the main flows.
- **Pack checks.** No pack admissions are seeded, so the pack-check paths were traced in code and scripts, not seen on a real demo receipt.
