ELAN1 GOVERN · FRONT END · CLOSED LIST

The 17 remaining changes

28 October 2026. This is the closed list from `15-fix-verification`. Nothing has been changed yet. It contains:

- **Changes 1 to 4:** the four remaining pieces of the five partly fixed items (two of them share a cause).
- **Changes 5 to 17:** the 13 side effects the earlier fixes introduced.

Each row says what is wrong, where it is in the code, and what the change would be.

17	1	15	1
CHANGES	MEDIUM (AFFECTS A REAL FLOW)	LOW (WORDING, DOCS, EDGE CASES)	NEEDS YOUR DECISION

> **What "done" means.** Make these 17 changes. Then check only these 17, plus the type-check, the build, the verifier test vectors and a link crawl at each level. Don't run another open-ended "check everything".

A. The 4 remaining pieces of partly fixed items

#	LEVEL	SEVERITY	WHAT IS WRONG, AND THE CHANGE
1	L1 / All	Low	**"Erased data" still listed on Not done** (report 11 #16 and 13 #17). The page lists an "Erased data" refusal class tagged "starts at L2". It is always empty, because nothing produces that refusal. **Change:** remove the class from Not done, as was already done in Activity. work/notDone.ts:45; work/NotDonePage.tsx:142–145
2	L1	Low	**"Signed" in L1 developer-portal copy** (report 13 #3). The quickstart note, the Rulebook YAML page and the glossary say the rulebook is "signed with your organisation's key", at every level. **Change:** word these neutrally: the rulebook is published, and from L2 each version is also signed. developers/sections/Start.tsx:91; developers/sections/Rules.tsx:5, 47, 109, 115; mock/devpathData.ts:290
3	All	Low	**Receipt page misreads some guard refusals** (report 13 #36). The receipt page's table of guard rules is missing these ids: `tool-disabled`, `G1_NO_CONSENT`, `G1_WITHDRAWN`, `G1_EXPIRED`, `G1_CHANNEL`, `RECEIPT_WRITE_FAILED` and `POLICY.TENANT_STOPPED`. It still lists `counterparty-unverified`, which nothing writes. So these refusals show a wrong "rulebook version not held" banner, and Refusals doesn't mark them as refused by the guard itself. **Change:** add the 7 ids with plain explanations, remove the unused one, and use the same list in the receipt page and Refusals. activity/shared.tsx:134–151; activity/ReceiptPage.tsx:707; assurancedoor/RefusalsPage.tsx:76–84
4	L2+	Decision	**Evidence bundle file names** (report 11 #31). The bundle's file names differ from the specification, for example `receipts.jsonl` rather than `chain.json`. They are mapped in a developer-docs table. **Your choice:** • **(a) Keep the names with the documented mapping.** Recommended. No code change, and bundles already exported stay valid. • **(b) Rename to the specification's names.** Bundles exported before the change would no longer match. mock/platform.ts:979–986; lib/verify6.ts:57, 65; developers/sections/Evidence.tsx:192

B. The 13 side effects of the earlier fixes

#	LEVEL	SEVERITY	WHAT IS WRONG, AND THE CHANGE
5	L3, Sov	Medium	**Onboarding locks key and level changes for 30 days.** When a new L3 or Sovereign organisation is onboarded, the key ceremony now publishes a successor key that only takes over after the 30-day overlap. Until then, further key changes and level changes are refused. **Change:** the first ceremony during onboarding creates the organisation's first own key and signs with it at once. There is no earlier key to overlap with. Later rotations keep the 30-day overlap. onboarding/complete.ts:104; api/index.ts:686; mock/platform.ts:768; mock/keys.ts:353
6	L2	Low	**Agents › Keys offers a rotation that will be refused.** While a successor key is waiting to take over, the "Request a KMS rotation" button still shows; pressing it is refused and recorded. Its Withdraw button also writes the receipt directly instead of through the checked path. **Change:** use the same shared pending check and withdraw path as Proof › Keys. agentsdoor/KeysPage.tsx:160–168
7	All	Low	**Anyone can withdraw someone else's token request.** Withdrawing a control or operations token request doesn't check who made it, and Withdraw also shows on approved requests. **Change:** only the requester can withdraw, and only while the request is waiting. keys/tokenStore.ts:170–181; keys/PlatformTokens.tsx:80–82
8	All	Low	**Developer docs use the old report section name.** They still say "Clauses" in the changelog and the sample output, and their Scope line has no write types. **Change:** use "Clause results" and add write types, to match the console and `/verify`. developers/sections/More.tsx:183; developers/sections/Platform.tsx:114, 122
9	L2	Low	**First close-out bundle isn't tied to its export.** The upgrade close-out accepts the file with an export id, but doesn't check that the file's digest matches the recorded export. **Change:** compare the digests, as evidence requests already do. mock/upgrade.ts:638–642
10	All	Low	**Demo billing desk credit trusts the screen.** When a dispute is settled, the credit amount comes from the screen. **Change:** read the disputed line's amount from the invoice and cap the credit at it. This affects the demo only. mock/billing.ts:291, 351
11	L3	Low (latent)	**A future autonomy grant could bypass a pack's named person.** When a rulebook hold already meets a pack's "a named person decides" rule, a future A4 or A5 grant could let the call run with no person. It can't happen today, because A4 and A5 are not available. **Change:** mark such holds so autonomy can never release them. mock/packChecks.ts:162–165; mock/db.ts:1061
12	All	Low	**Wrong control number on the People page.** It says member changes count towards "control EG-11", which is the AI inventory control. **Change:** say EG-20 (role-based access changes). settings/sections/Members.tsx:193

13	L2+	Low	**Cookie table is missing a storage key.** It doesn't list `eg:evidence:sent:<org>:<request>`, where the files of a fulfilled evidence request are kept in the browser. **Change:** add it, saying what it holds and that "Reset demo data" clears it. mock/keys.ts:903; legal/LegalPage.tsx
14	L1–L3	Low	**Privacy notice understates the WhatsApp number's use.** It says the number is used only to send approval links. **Change:** add that it can also be used to approve or reject with chat buttons, and is recorded with that decision. legal/LegalPage.tsx:82
15	All	Low	**The L3 receipt-code pages contradict themselves.** The facts table says "a refusal receipt on the chain", but the text says the received receipt is rejected and not added to your chain. **Change:** make both say what the code actually does. mock/devpathData.ts:156; developers/sections/Register.tsx:152
16	All	Low	**Out-of-date WhatsApp line in the Rulebook YAML reference.** It says WhatsApp "always sends a signed link to the decision page". **Change:** say that WhatsApp, like Slack, carries Approve and Reject buttons on rules approvable in chat. developers/sections/Rules.tsx:72
17	All	Low	**README overstates the fixes.** It says every finding in reports 11 and 13 is fixed. **Change:** correct it once changes 1 to 16 are done and verified. README.md:72, 90

C. How these would be done and checked

- **Size.** Change 5 is a small change to onboarding. All the others are one-line to few-line edits. One agent can make all of them; they don't need parallel fixers.
- **Afterwards:**
  - verify each of the 17 against the code, as in `15-fix-verification`;
  - run the type-check, the production build and the 64 Seal v6 test vectors;
  - onboard a test L3 organisation to confirm change 5;
  - re-crawl all four levels for broken links.
- **Pricing.** None of the 17 touches pricing, and the refusal rate stays as it is.
